ORDER

Sub.: Release of SIP Connections-Directions for industrial focus.

Instructions were issued for release of new SIP as well as MIP connections vide order No. 224 dated 4.2.2005 (JPR5-252). These instructions were mainly intended to minimize incidence of theft of electricity. It has now been decided to modify these instructions in the following manner:-

Release of new SIP connections:

It was prescribed in the order JPR5-252 that for release of new SIP connection the distribution transformer with inhouse metering is to be released. The meter installed on the transformer was to serve as the main meter for the connection. It is now directed that the inhouse meter housed on the distribution transformer is to serve as a check meter and not as a main meter of the consumer. The main meter of the consumer is required to be installed at his premises which should be a "push fit type" meter to rule out possibility of tempering and theft of energy by the consumer.

Other instructions as laid down in the order would remain unaltered. Relaxation as allowed vide order No. 1284 dated 2.7.2005 (JPR5-281), however, shall also remain applicable.
